Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               acidic ribosomal protein P2.e.B, cytosolic - yeast (Saccharomyces cerevisiae)
N.Alternate names: acidic ribosomal protein P2.alpha; protein D9481.1; protein YDR382w;
C.Species: Saccharomyces cerevisiae
C.Date: 31-Oct-1980 #sequence_revision 31-Mar-1992 #text_change 21-Ju1-2000
C.Accession: A35109; A28104: A02776; S61177; S69666
R.Newton, C.H.: Shimmin, L.C.; Yee, J.; Dennis, P.P.
J. Bacteriol. 172, 579-588, 1990
A.Tille: A family of genes encode the multiple forms of the Saccharomyces cerevisiae rib
protein.

T09084
phosphatidylinositol 3-kinase - Chlamydomonas reinhardtii (fragment)
C.Species: Chlamydomonas reinhardtii
C.Species: Chlamydomonas reinhardtii
C.Date: 11-Jun-1999 #sequence_revision 11-Jun-1999 #text_change 21-Jul-2000
C.Accession: T09084
R.Molendijk, A.J.; Trvine, R.F.
Plant Mol. Biol. 37, 53-66, 1998
A;Title: Inositide signalling in Chlamydomonas: Characterization of a phosphatidylinosit
A;Recence number: 216411; MUID:98281574
A;Accession: T09084
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: DNA
A;Molecule type: DNA

Patent No. 5750652
GENERAL INFORMATION:
APPLICANT: Busseau, Isabelle
APPLICANT: Busdeau, Isabelle
APPLICANT: Diederich, Robert J.
APPLICANT: Matsuno, Kenji
TITLE OF INVENTION: BELTEX PROTEINS, NUCLEIC ACIDS, AND
TITLE OF INVENTION: ANTIBODIES, AND RELATED METHODS AND COMPOSITIONS
NUMBER OF SEQUENCES: 23
                                                                                                                                                                      APPLICANT: Rodriguez, Raymond
TITLE OF INVENTION: Rice Beta-Glucanase Enzymes
TITLE OF INVENTION: and Genes
NUMBER OF SEQUENCES: 66
CORRESPONDENCE ADDRESS:
ADDRESSEE: Dehlinger & Associates

Modifying and attaching therapeutic peptides to albumin prevents

The present invention describes a modified therapeutic peptide (I) and a comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity peptides are not suitable as drug candidates as they require frequent aministration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases. ABB90829 to ABB92441 represent peptides which can be used in the acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth
a less therapeutically active amino acid region (IV), which covalently bonds with amino/yydroxy//thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
                                                                                                                                      Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protection; endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protection, endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently conds with amino/Nydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or caluces the action of peptidases to increase length of activity (half clife) and specificity as bonding to large molecules decreases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity
Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracelular uptake and interference with physiological processes. AAB99829 to AAB92441 represent peptides which can be used in the exemplification of the present invention.
                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protection, endogenous therapeutic peptide; peptidase; conjugation; blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

```
The present invention describes a modified therapeutic peptide (I)

comprising a therapeutically active amino acid region (III) and a
reactive group (II) (e.g. succinimidyl and maleimido groups) attached to
a less therapeutically active amino acid region (IV), which covalently

conds with amino/Mydroxyl/thiol groups on blood components to form a
peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifying therapeutic peptides e.g. hormones, growth
factors and neurotransmitters, to protect them from peptidase activity
in vivo for the treatment of various disorders. Endogenous therapeutic
peptides are not suitable as drug candidates as they require frequent
administration due to rapid degradation by peptidases in the body.

Modifying and attaching therapeutic peptides to albumin prevents or
reduces the action of peptidases to increase length of activity (half
iffe) and specificity as bonding to large molecules decreases
intracellular uptake and interference with physiological processes.

Also claimed, a purified segment of DNA comprising a functional translocatable positive LDL receptor gene promoter control element. The example reflects experiments conducted to display generally the positive capability of the 5'-regions of human LDL receptor. First base in AAN80195 is designated -240 in Fig 1.

```

```
Peptide core is repeated 2-20 times to form a cell-adhesive protein of mol. wt. 1,500-5,000. The protein is an (ant)agonist of cell-adhesive proteins such as fibronectin. It has high antimetastatic activity against cancer and can be used in immunomodulation, wound healing, platelet aggregation inhibition and alleviatigon of neuro-disorders. See also AR00722.
          acidic aminoacid, effective against virus with protein-terminated DNA or RNA.
                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cell adhesion; anti-metastatic agent; immunomodulation; core repeat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                 Peptide is effective against inhibiting propogation of DNA or RNA bonded, protein containing viruses eg. Poliovirus, Hepatitis virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Polypeptide with repeated sequences of cell adhesion protein used as anti-metastatic agent for cancer and agonist or antagonist of cell-adhesion proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                             The inventors claim synthetic peptides which correspond to sequences occurring in EGF, but excluding EGF. The peptides are angiogenic and have corresp. applications, eg for the healing of wounds and burns. Their relative shortness means that they pose fewer synthesis problems than the entire EGF molecule. They can be admin. Singly or association with each other or in association with an angiogenic

Prevention of adhesion formation, partic. post-surgically - comprises administering a RGD-contg. peptide for a time sufficient to permit tissue repair
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "C9H19CO-Arg, C13H27CO-Arg, C15H31CO-Arg, CH3-[(CH(CH3)-(CH2)3]3-CH(CH3)-CH2-CO-Arg or CH3-[(CH(CH3)-(CH2)3]2-CH(CH3)-CH2-CO-Arg"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The secuence is that of an RGD-contg. peptide which is used in a method for prevention of adhesion formation for a time sufficient to permit tissue repair. The method is used for minimising or preventing adhesion formation, partic. in the peritoneum following surgery, but also for e.g. cardiovascular, orthopedic, thoracic, ophthalmic, CNS and other uses. In addn., the peptide inhibits platelet aggregation and does not induce inflammation or trauma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pharmacological activity of an active peptide by preparing an accountion of a liquid polymer modified version of the peptide by solution of a liquid polymer modified version of the peptide by covalently binding the peptide to a biocompatible prepolymer under a conditions. The prepolymer is a triol or higher polyol made up of at least 75% oxyethylene monomers, has mol.wt. 7000 - 30,000 and has all least 75% oxyethylene monomers, has mol.wt. 7000 - 30,000 and has all least 75% oxyethylene monomers, has mol.wt. 7000 - 30,000 and has all energy pref. isophorone discovanate or methylene bis(cyclonexyl discovanates, pref. isophorone discovanate or methylene bis(cyclonexyl discovanate). The covalent bond is between an NCO group on the prepolymer and an amino, SH, OH or COOH group on the peptide. The modified peptides have increased potency, decreased immunogenicity and longer circulation half-life than the free peptides.

Suitable peptides include alkaline phosphatase, haemoglobin, RGD suitable and GHK peptides. The modified peptides mad GHK peptides and conference of wound healing, burn healing and angiogenesis, and for inhibition of atherosclerosis or tumour cell mestasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bioactive peptide improvement by isocyanate-capped poly:ol conjugation - giving prods. which are more potent, have decreased imunogenicity and longer circulation half life
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δy
                                                                                                                                                                                                                                                                                                                                                                      RESULT 2
557609
protegin 5 precursor - pig
protegin 5 precursor - pig
protegin 5 precursor - pig
N'Alternate names: cathelin-associated antimicrobial peptide
C'Species: Sus scrofa domestica (domestic pig)
C'Date: 19-oct-1995 #sequence_revision 03-Nov-1995 #text_change 16-Jul-1999
C'Accession: S66283; S57609
R'Sibno, C.; Ganz, T.; Lehrer, R.I.
FEBS Lett. 368, 197-202, 1995
A;Title: The structure of porcine protegrin genes.
A;Reference number: S66283; MUID:95354835
